

Cross-Validation

Use cross-validation to evaluate parameters for XGBoost.

Chapter Goals:

- Learn how to cross-validate parameters in XGBoost

A. Choosing parameters

Since there are many parameters in XGBoost and several possible values for each parameter, it is usually necessary to *tune* the parameters. In other words, we want to try out different parameter settings and see which one gives us the best results.

We can tune the parameters using cross-validation

([https://en.wikipedia.org/wiki/Cross-validation_\(statistics\)](https://en.wikipedia.org/wiki/Cross-validation_(statistics))) (for a detailed explanation of cross-validation, see the **Data Modeling** section). In

XGBoost, the `cv`

(https://xgboost.readthedocs.io/en/latest/python/python_api.html#xgboost.cv) function performs cross-validation for a set of parameters on a given training dataset.

The code below demonstrates cross-validation in XGBoost.

```
1 # predefined data and labels
2 dtrain = xgb.DMatrix(data, label=labels)
3 params = {
4     'max_depth': 2,
5     'lambda': 1.5,
6     'objective':'binary:logistic'
7 }
8 cv_results = xgb.cv(params, dtrain)
9 print('CV Results:\n{}'.format(cv_results))
```

Output

3.662s

[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:16] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro

The output of `cv` is a pandas DataFrame (see the **Data Processing** section for details). It contains the training and testing results (mean and standard deviation) of a K -fold cross-validation applied for a given number of boosting iterations. The value of K for the K -fold cross-validation is set with the `nfold` keyword argument (default is 3).

The keyword argument `num_boost_round` specifies the number of boosting iterations. Each boosting iteration will try to improve the model through gradient boosting. The default number of iterations is 10.

```
1 # predefined data and labels
2 dtrain = xgb.DMatrix(data, label=labels)
3 params = {
4     'max_depth': 2,
5     'lambda': 1.5,
6     'objective': 'binary:logistic'
7 }
8 cv_results = xgb.cv(params, dtrain, num_boost_round=5)
9 print('CV Results:\n{}'.format(cv_results))
```

Output

2.375s

[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 ro

```
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 pruned nodes, 1 nodes left, 1 nodes in the tree
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 pruned nodes, 1 nodes left, 1 nodes in the tree
[08:54:17] /workspace/src/tree/updater_prune.cc:74: tree pruning end, 1 pruned nodes, 1 nodes left, 1 nodes in the tree
```
